Education

University of Michigan – Ann Arbor

June 2025

BS in Computer Science, BS in Economics

Ann Arbor, MI

- Relevant Coursework: Software Engineering, Databases, Systems Design, Machine Learning, Applied Econometrics

Engineering & Research

Languages: Python, TypeScript, JavaScript, SQL.

LLM Engineering: Claude API (sampling, batch, structured prompts), MCP (Model Context Protocol) servers, prompt design and iteration with regression gates, eval harness construction.

Research Methodology: adversarial test-case design, multi-stage grader systems, regression-detection across prompt versions, Wilson confidence intervals on small-N empirical claims, multi-agent governance with self-critique loops.

Production Engineering: APIs, web scraping, workflow orchestration, data enrichment pipelines, Flask + Okta SSO + role-based access, Railway deployment with build-stamped verification.

Spoken: English – Native, German – Intermediate (B2), Spanish – Basic (A2).

Experience

Revivn

Feb 2026 – Present

Go-to-Market Engineer

Brooklyn, NY

- Built Claude-powered scoring, validation, and quality audits across the company’s prospect pipeline: a 6-iteration ICP scoring model validated against top-25-ACV revenue, two Claude Opus 4.7 batch quality audits producing 692 verified disqualifiers from a 4,100-account universe, and a full-pool Clay enrichment pipeline that verified 2,749 companies in a single run — structured prompting, batch evaluation, and ground-truth reconciliation throughout.
- Architected the underlying integration stack in Python and TypeScript, connecting 9 external systems (Snowflake, Salesforce, Clay, Brave Search, Anthropic API, Slack, Google News, ZoomInfo, Okta) into a single pipeline that filters 18,000 raw company entries down to a verified universe of 4,100+ ICP prospects with 99.8% SFDC.ID coverage on signed clients. 351 commits across 9 weeks.
- Shipped the production tooling sales uses daily: a Flask dashboard with Okta SSO and role-based access for admins, leadership, and reps, a 24/7 Slack alert daemon on Railway with multi-gate deduplication and build-stamped deployment verification monitoring 4,500+ accounts for high-intent signals, and an automated territory distribution workflow with sandbox dry-run mode.
- Translated open-ended growth questions into shipped systems — ran the ZoomInfo audit and recommended non-renewal by building the Clay-based contact waterfall as the replacement, drove SFDC.ID coverage from 74.7% to 99.8% on signed clients in one day, and authored a cohort-survival forecasting framework with tier-aware churn definitions for financial modeling.

Student Section

Oct 2024 – Present

Co-Founder and Product Engineer

Ann Arbor, MI

- Co-founded a peer-to-peer student ticket marketplace serving the University of Michigan campus, scaling to 3,000+ active users and 300–400 tickets sold per home game, with \$76,000+ in student transactions safeguarded against scams.
- Designed and shipped the ticket listing and checkout flows on Stripe Connect, owning client-side state transitions, backend validations, and seller payout records so transactions executed predictably across both buyer and seller journeys under real load.
- Wrote reconciliation logic for listing states, transfer confirmations, and payout records that audited the marketplace’s invariants continuously and held operational load flat as transaction volume grew.
- Instrumented marketplace events to identify drop-off points across the funnel, then iterated on UI copy and flow sequencing alongside the founding team — improving clarity without introducing operational risk.

Bishop’s Bricks

Jan 2014 – Present

Founder and Operator

Remote

- Built automation that synchronizes inventory and pricing across marketplaces, handling edge cases where platform rules conflict with internal stock logic.
- Wrote data utilities tracking order states, disputes, and fulfillment timing, improving operational visibility under high transaction volume.
- Diagnosed system failures by tracing data inconsistencies across listing, checkout, and shipping events; converted manual workarounds into repeatable scripted fixes.

Activities

- **Mensa** — Inducted 2022.
- **Association for Computing Machinery** — Inducted 2021.
- **Neuroscience Club** — 2021–2023.
- **Finance Association** — 2021–2023.
- **EMT (Universal EMS – Detroit)** — June 2021–Aug 2021.
