

BISHOP KAMMERAAD

☎ +1-248-403-1677 ✉ kammeraa@umich.edu 🔗 linkedin.com/in/bishop-kammeraad 🐙 github.com/porkedchop

Go-to-market engineer who turns slow, manual revenue workflows into AI agents people actually adopt. Owns the full cycle: scoping with the team, building on the data stack, shipping, measuring, iterating.

EXPERIENCE

Revivn

Feb 2026 – Present

Go-to-Market Engineer

Brooklyn, NY

- Built and own the GTM platform for a 19-rep revenue team: ICP scoring of 15,700 prospect companies, a dashboard leadership uses as the prospecting source of truth, and the pipelines behind it (Snowflake, Salesforce, Fivetran, Clay, Postgres) running on Railway. Ship to production daily.
- Built Revvy, an AI copilot reps use every day: reads the CRM, call transcripts and email, drafts outreach in each rep's own voice, and preps meetings. Red-teamed before every release by running the agent as each rep; its one hard rule is that no rep ever sees another rep's book.
- Drove adoption without a mandate: an **/enrich** agent rolled out to 19 reps through direct onboarding, then a written evaluation that ended the ZoomInfo contract in favor of the internal replacement.
- Automated the marketing-to-sales handoff: website visitor de-anonymization routed to a Slack digest, champion job-change tracking with a Monday email digest to leadership, and an inbound router that classifies and assigns leads instead of round-robin.
- Ran the model layer on evidence: cost-aware routing across Haiku, Sonnet and Opus (3,000+ contacts scored for ~\$50), an Opus judge that re-reads every lost deal's calls and audits the loss reason a human entered, and a retrieval layer evaluated head-to-head against vector RAG before choosing.
- Found and fixed a warehouse billing 24 hours a day while 60% idle: cut overnight warm time 41% and wrote the postmortem, rules and lint hook that keep it fixed. Same discipline on feedback: audited a lead-dismiss feature and found it had never fired because its failure was silent.

Student Section

Oct 2024 – Present

Co-Founder and Product Engineer

Ann Arbor, MI

- Co-founded a student ticket marketplace on Stripe across four campuses; own product, growth and the money (pricing, fees, tax, payouts, disputes). Campus onboarding is a config change, not a project.
- Built an unattended agent that transfers paid tickets between a vendor portal and an escrow inbox, with human-in-the-loop guardrails: nothing is recorded until the vendor confirms it, ambiguous cases are refused, and every failure pages a person.
- Program managed the App Store launch: go/no-go review, blockers tracked to closure, privacy and platform compliance cleared. The review caught a sign-in bug that would have locked out every returning user.

Bishop's Bricks

Jan 2014 – Present

Founder and Operator

Remote

- Twelve-year LEGO resale business across multiple marketplaces. Automated listing, pricing and inventory sync once manual reconciliation stopped scaling.

SELECTED WORK

- **Revvy Retrieval Layer** (Claude, Python): 22-node indexed knowledge tree and 27-tool registry split hot/cold; agentic progressive disclosure fetches 150–250-token leaves on demand. Cut the standing prompt ~4,100 tokens per message.
- **Weekly digests from data that already existed**: champion moves, KPI rollups and client-health flags generated from the warehouse and delivered by email and Slack, replacing hand-assembled reports.
- **Repo-level context layer**: runbooks, postmortems and a 'read this first' map so the next engineer, or the next agent, starts from the pattern instead of scratch.

SKILLS

Agents & LLMs: prompt and context engineering, tool design, structured outputs, task chaining, evals and red-teaming, cost-aware model routing, human-in-the-loop design, Anthropic / OpenAI APIs, Claude Code, MCP.

Revenue & Data Stack: Salesforce, Outreach, Clay, Fivetran, Snowflake, Postgres, Slack and Gmail integrations, web intent and de-anonymization, lead scoring and routing, enrichment pipelines.

Engineering: Python, SQL, TypeScript/JavaScript, Flask, Railway, Docker, C++, Java, R.

Ways of working: scoping with non-technical stakeholders, written postmortems, go/no-go reviews, closed betas. German – B2, Spanish – A2.

EDUCATION

University of Michigan – Ann Arbor

June 2025

BS in Computer Science, BS in Economics

Ann Arbor, MI

- **Mensa**, inducted 2022. **Association for Computing Machinery**, inducted 2021. **EMT**, Universal EMS Detroit, 2021.
